SMALL TREES (grow less than 30' in height)

MEDIUM TREES (grow 30' to 70' in height)

TALL TREES (grow 70' or taller)

- Planting large trees under utility lines can eventually mean mutilated trees as they grow to maturity. Short, flowering trees don't clash with overhead utility lines.
- Planting an evergreen windbreak on the north side of the house can block icy winter winds.
- Large deciduous trees on the southeast, southwest, and west provide cooling shade in the summer, while not obstructing the low winter sun.
